EDUCATION & CERTIFICATIONS

UNIVERSIDAD CATOLICA ANDRES BELLO (UCAB)

B.S. in Computer Engineering

Caracas, Venezuela

2022 – Present

FORTINET NETWORK SECURITY ACADEMY

Fortinet Certified Fundamentals in Cybersecurity (NSE 1 & NSE 2)

Languages: Spanish (Native), English (B2 Level - Technical / Professional).

CORE TECHNICAL STACK

Data & Artificial Intelligence: Python, TensorFlow, Keras, Pandas, Scikit-learn, LLMs (Claude, OpenAI API), Prompt Engineering, Monte Carlo Tree Search (MCTS).

Backend & Cloud: Node.js, Java 23 (Spring Boot 3), Deno, Docker, gRPC, RESTful APIs.

Databases & Tools: PostgreSQL, SQLite, H2, Git/GitHub, Agile Methodologies (Scrum).

PROFESSIONAL EXPERIENCE & AI PROJECTS (2023 - Present)

Connect6 AI Agent | Artificial Intelligence Architecture

- Optimized real-time tactical decision-making and increased agent precision by drastically reducing the logical search space, implementing a heuristic engine based on Monte Carlo Tree Search (MCTS).
- Ensured ultra-low latency inferences by isolating predictive models, orchestrating Deep Learning architectures (TensorFlow/Keras) through independent microservices using gRPC and Docker containers.

Puntos Internet Web (VEinteligente) | Data Pipeline & Telemetry

- Guaranteed continuous availability of datasets for critical infrastructure audits, processing thousands of network records without bottlenecks, by automating massive data ingestion pipelines in Python.
- Maintained analytical system integrity by consuming and structuring dynamic information from external REST APIs (Starlink) into SQLite operational databases using Cron routines on a Linux VPS.

Secure Firmware Portal | Applied Security (AppSec) in Python

- Mitigated critical OWASP Top 10 vulnerabilities (including RCE vectors), securing ecosystem integrity, by integrating strict cryptographic controls (PBKDF2, HMAC-SHA256) in a Python/Flask environment.
- Prevented malicious code injections through the implementation of advanced input validation and sanitization mechanisms within the data pipeline.

B2B Aldebaran Platform | Backend Architecture

- Reduced initial deployment complexity in B2B commercial operations, optimizing server configuration time, by implementing a scalable zero-config architecture in Java.
- Streamlined the integration of future microservices by developing a robust RESTful API on top of the Spring Boot 3 ecosystem.

Viajes UCAB | Database Optimization

- Improved web server transactional performance, eliminating application layer bottlenecks in Node.js, by logically delegating asynchronous report generation directly to PostgreSQL.
- Ensured relational data consistency by implementing stored procedures (PL/pgSQL) and automated triggers for complex business logic.

Batalla Naval (Multiplayer) | Real-Time Concurrency

- Guaranteed real-time bidirectional state synchronization for multiple game rooms, eliminating race conditions, by programming a concurrent multiplayer engine using Deno and WebSockets.

UNO Card Game | Object-Oriented Programming

- Ensured transactional state persistence across multiple sessions by integrating native data serialization (Gson) into an MVC architecture built with Java 21.

ADDITIONAL ACHIEVEMENTS

- Reto Banca Digital Banesco (2024) - First Place Winner: Ideated and designed an innovative value proposition for a banking application utilizing Lean Canvas methodology and rapid prototyping in Figma.
