EDUCATION & CERTIFICATIONS

UNIVERSIDAD CATOLICA ANDRES BELLO (UCAB)

B.S. in Computer Engineering

Caracas, Venezuela
2022 – Present

FORTINET NETWORK SECURITY ACADEMY

Fortinet Certified Fundamentals in Cybersecurity (NSE 1 & NSE 2)

CORE TECHNICAL STACK

Frontend: Vue 3 (Composition API), Vite, Vanilla JS (ES6+), HTML5/CSS3.

Backend: Node.js, Express.js, Deno, Java 23 (Spring Boot 3), Python (Flask).

Databases: PostgreSQL (PL/pgSQL), H2, SQLite.

Architecture & Tools: RESTful APIs, WebSockets, gRPC, Docker, Git/GitHub, Event-Driven Architectures.

ENGINEERING EXPERIENCE & NOTABLE PROJECTS

Puntos Internet Web (VEinteligente) | Telemetry System

- Designed and developed a telemetry system implementing a decoupled web architecture to audit connection quality in critical infrastructures.
- Automated the ingestion and processing of telemetry data via REST APIs, guaranteeing real-time monitoring of network indicators.

Connect6 AI Agent | Low-Latency Intelligent Agent

- Orchestrated an intelligent agent via ultra-low latency microservices using gRPC and Docker.
- Integrated a hybrid Deep Learning and heuristic models architecture for complex real-time decision making.

Secure Firmware Portal | AppSec Management Portal

- Developed a firmware management portal integrating strict cryptographic controls to effectively mitigate OWASP Top 10 vulnerabilities.
- Implemented advanced input validation and sanitization mechanisms to proactively prevent Remote Code Execution (RCE) vectors.

B2B Aldebaran Platform | End-to-End Management Platform

- Built an End-to-End commercial management platform powered by a scalable RESTful API utilizing Java and Spring Boot 3.
- Optimized B2B operations by implementing a zero-config architecture, reducing deployment complexity and initial setup time.

Viajes UCAB | Tourism Services Platform

- Developed a comprehensive platform for tourism services management utilizing a highly normalized relational database architecture in PostgreSQL.
- Logically delegated asynchronous report generation directly to the database layer via PL/pgSQL and triggers, improving overall system throughput.

Batalla Naval (Multiplayer) | Client-Server Game Engine

- Programmed a low-latency client-server game engine using Deno and WebSockets for real-time bidirectional synchronization.
- Managed concurrent game states efficiently across multiple simultaneous rooms with no performance degradation.

UNO Card Game | Java Desktop Application

- Created an event-driven desktop application built entirely in Java.
- Integrated a robust logic engine with asynchronous interfaces and native data serialization to guarantee state persistence across multiple sessions.

ADDITIONAL ACHIEVEMENTS

- Reto Banca Digital Banesco (2024) - First Place Winner: Ideated and designed an innovative value proposition for the banking application utilizing the Lean Canvas methodology and rapid prototyping in Figma.
